

# Initial Thread Dump Analysis Report

## Summary of Findings:

No threads are in a BLOCKED state.

No deadlocks or potential deadlocks were detected.

All RUNNABLE threads appear to be processing I/O tasks as expected.

Many threads are in the WAITING (parking) or TIMED\_WAITING state, which is common in thread pool and timer threads waiting for new tasks or notifications.

No threads display unusual or unexpected states that indicate high CPU usage or resource contention.

Based on the analysis of the provided thread dump, there are no thread-related issues that point to the reported error when sending a payload.
