

# Initial Thread Dump Analysis Report

## Summary:

No threads are in a BLOCKED state.

No deadlocks are observed.

Most threads appear in RUNNABLE or TIMED\_WAITING (parking) states, which is expected for I/O dispatchers, message processors, and timer tasks.

There is no indication of high CPU usage or of threads waiting excessively for resources.

The overall thread activity does not show any unusual states that would point to a systemic problem.

The error reported when sending a payload does not appear to be reflected by any abnormality in the thread dump.
