

Initial Thread Dump Analysis Report

Summary:

No threads are in a BLOCKED state and no deadlocks were detected.

All running threads appear in the RUNNABLE state while many others are in WAITING (parking) or TIMED_WAITING states.

The I/O dispatcher threads (HTTP■Sender, HTTPS■Sender, HTTP/HTTPS■Listener) are all in their RUNNABLE state holding expected locks.

A large number of PassThroughMessageProcessor threads are waiting (parking) on an object monitor. This pattern is expected if the system's thread pool is idle or waiting for tasks, and does not necessarily indicate a problem.

There are no indications of high CPU usage or resource contention from the dumps.

Overall, no unusual or problematic thread states were observed.
